CC cyclin-dependent kinase (CDK) inhibitor (see AAW98179) of Arabidopsis CC thaliana. New plant products with a putative CDK inhibitory CC function were screened by using a two-hybrid system with CDC2aAt CC function were screened by using a two-hybrid system with CDC2aAt CC protein as bait and a library made from an RNA mixture of A. CC thaliana cell suspensions harvested at the early exponential, carly stationary and stationary phases. Positive CC exponential, early stationary and stationary phases. Positive CC clones LDV39, LDV66 and LDV159 were obtained. Clone FL39 was CC isolated from a flower CDNA library using partial clone LDV39 as CC isolated from a flower CDNA library using partial clone LDV39 as CC isolated from ALFCDKI (see AAX25018), was obtained from CC alfalfa. Results established that several CDK inhibitors exist concent the points and may have different functions during the development CC isolated recombinant DNA and vectors are all useful: for CC diagnosis (no details); for modulating the cycle, division and/or CC growth of plant cells; for altering activity of CDK; for modulating cromoter inhibition in plants caused by environmental stress; for CC inducing male or female sterility; for altering cell division cells; cand to screen for agonists or antagonists that are potentially CC useful as growth regulators or herbicides. Plants of any sort can be treated, e.g. to alter their size or resistance to disease.

                                                                                                                                                                                                                                                                                                                                                                      285
```

١ı

gene in a plant. BRO4 is useful for increasing the proportion of dividing cells in a plant cell population comprising protoplast, seeds, root cells, meristem cells or leaf cells.

```
seq_name: /SIDS2/gcgdata/geneseq/geneseqn/NA2001.DAT:AAC85204
     The sequence given in AAC85204 represents a plant D1 cyclin inhibitor gene, BRO3. This sequence was isolated using a yeast two hybrid screen. The BRO3 protein was found to contain a seven amino acid sequence cyclin binding domain similar to that of BRO1, BRO2 and BRO4 (See also AAB47005-6). This sequence is homologous to a sequence present in a D-like cyclin inhibitor gene and when integrated at the corresponding locus, functionally inactivates plant D-like cyclin inhibitor protein expression. The BRO4 coding sequence may be used to produce a hyperplastic variant plant, increase the growth rate of a plant, or increase the proportion of dividing cells in a plant cell population, relative to a wild-type plant, by functionally increase the proportion of dividing cells in a plant cell population, relative to a wild-type plant, by functionally
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       _documentation_block:

                                                                                                                                                                                                              The present sequence is a cDNA encoding ICK2 which inhibits A. thaliana Cyclin-Dependent kinase (CDK). Interactor of Cdc2 kinase 2 (ICK2) interacts with Cdc2a, b-class cyclins, CycD1, CycD2 and CycD3 and shares functional and sequence similarity with ICK1. Growth, morphogenesis, multiplication, enlargement, differentiation and maturation of plant cells can be modified by transforming them with nucleic acid encoding CDK inhibitor or antisense construct complementary to the inhibitor gene, operably linked to a tissue-specific promoter. The transgenic plants exhibit alteration of traits such as petals, male sterility and ability to set seeds.
                                                                                                                                                                                                                                                                                                                                                        Modifying plant cell development using nucleic acid encoding inhibitor of cyclin-dependent kinase, or corresponding antisense sequence, e.g. for inducing male sterility -
                                                                                                                                                                                                                                                                                                                                                                                                                                  Wang

```
The present sequence is a cDNA encoding A. thaliana Cyclin-Dependent kinase (CDK) inhibitor, ICK1. Interactor of Cdc2 kinase 1 (ICK1) interacts with Cdc2a, D-class cyclins, CycD1, CycD2 and CycD3. Growth, morphogenesis, multiplication, enlargement, differentiation and maturation of plant cells can be modified by transforming them with nucleic acid encoding CDK inhibitor or antisense construct complementary to the inhibitor gene, operably linked to a tissue-specific promoter. The transgenic plants exhibit alteration of traits such as petals, male sterility and ability to set seeds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Modifying plant cell development using nucleic acid encoding inhibitor of cyclin-dependent kinase, or corresponding antisense sequence, e.g. for inducing male sterility

Interactor of Cyclin 6 (ICN6) interacts with Cdc2a, D-class cyclins, CycD1, CycD2 and CycD3 and shares functional and sequence similarity with ICK1. Growth, morphogenesis, multiplication, enlargement, differentiation and maturation of plant cells can be modified by transforming them with nucleic acid encoding CDK inhibitor or antisense construct complementary to the inhibitor gene, operably linked to a tissue-specific promoter. The transgenic plants exhibit alteration of traits such as petals, male sterility and ability to set seeds.

                                                                                                                                                              The sequence given in AAC85201 represents a plant D-like cyclin inhibitor gene, BR04. This sequence may be used to produce a hyperplastic variant plant, increase the growth rate of a plant, or increase the proportion of dividing cells in a plant cell population, relative to a wild-type plant, by functionally inactivating the expression of a plant D-like cyclin inhibitor gene in a plant. This sequence is homologous to a sequence present in a D-like cyclin inhibitor gene and when integrated at the corresponding locus, functionally inactivates plant D-like cyclin inhibitor protein expression. BR04 is useful for producing hyperplastic variant plants, increasing the growth rate of a plant and for increasing the proportion of dividing cells in a plant cell population comprising protoplast, seeds, root cells, meristem cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Functionally inactivating expression of plant D-like cyclin inhibitor gene for producing a hyperplastic variant plant, modulating the growth and/or yield of plants, and increasing the proportion of dividing cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Plant; D-like cyclin inhibitor gene; BRO4; growth rate; dividing cells; inactivation; root cell; meristem; leaf; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            607
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               560

Interactor of Cyclin 2 (ICN2) interacts with GGC2a, D-class cyclins, CycD1, CycD2 and CycD3 and shares functional and sequence similarity with ICK1. Growth, morphogenesis, multiplication, enlargement, differentiation and maturation of plant cells can be modified by transforming them with nucleic acid encoding CDK inhibitor or antisense construct complementary to the inhibitor gene, operably linked to a tissue-specific promoter. The transgenic plants exhibit alteration of traits such as petals, male sterility and ability to set seeds.

Dependent kinase (CDK). CDKII interacts with Cdc2a, D-class cyclins. CycD1, CycD2 and CycD3 and shares functional and sequence similarity with ICKI. Growth, morphogenesis, multiplication, enlargement, differentiation and maturation of plant cells can be modified by transforming them with Agrobacterium strain harbouring an expression construct of CDKII. The transgenic plants exhibit alteration of traits such as petals, male sterility and ability to set seeds.
